

An apple a day wont keep the hay fever away...

Monday 23 April, 2012

Allergy UK reveals how having five a day can cause havoc for hay fever sufferers

If pollen wasnt making the nation miserable enough, [Allergy UK](#) reveals that eating fruit and veg can unwittingly cause problems for some hay fever sufferers.

New consumer research from the national medical charity reveals **40% of hay fever sufferers also react to one or more of nuts, fruit, vegetables or spices.**

Pollen from trees and plants, especially birch, causes major problems for allergy sufferers in the UK. But the protein found in certain pollens is similar to that found in some foods putting hay fever sufferers at risk from another allergic condition, oral allergy syndrome.

Lindsey McManus, Allergy UK explains: 15 years ago oral allergy syndrome was considered unusual but now it is increasingly commonplace. The condition is caused by the proteins in some fruit, nuts, vegetables and spices triggering a cross-reaction in someone with hay fever. When they eat a food that shares similar proteins as the pollen, it can cause an allergic reaction, such as, an itchy mouth, swelling or tingling of lips and tongue.

With 15 million Brits suffering from seasonal allergic rhinitis or hay fever, the arrival of spring already signals months of misery. But a quarter of sufferers (24%) didnt even realise that foods could also trigger a reaction.

So while, according to the charity, 72% of those with hay fever suffer for more than two months, they could suffer from problems all year round because of a cross reaction with healthy foods. Furthermore, these foods can actually make hay fever symptoms worse.

Prisoners to Pollen

This **National Allergy Week (23rd - 29th April)** Allergy UK is highlighting the true impact hay fever has on the nation.

A worrying **15% of sufferers are so affected by their hay fever they are prisoners to pollen and dont like leaving their own house.**

Nearly a quarter (23%) of adult hay fever sufferers say the condition makes them miserable. 38% find it difficult to sleep, 29% feel unable to concentrate, whereas one in five (20%) say it makes it hard for them to do their job.

Top Five UK Allergens

The research from Allergy UK also revealed more allergy sufferers react to pollen than anything else. But if you seek solace indoors, the home could inadvertently trigger an allergic reaction, with house dust mite being a top three allergen.

This National Allergy Week, the charity reveals the top five allergens affecting the nation:

- 1.Pollen
- 2.Food
- 3.House dust mite
- 4.Pets
- 5.Medication

Pets are a huge catalyst for allergic reactions, with 40% of those with allergies suffering as a result of our four legged friends. While it is commonly assumed it is the hair of the animal that causes a reaction it is actually the dander - particles of skin, saliva and urine invisible to the human eye. Cats are far more allergenic than dogs as their allergen is sticky so stays around for a long time, made worse by the fact they love to self groom. But pollen can also cause problems in the home as carpets can harbour pollen for up to three months.

According to the survey, medication is the number five allergen in the UK. Lindsey McManus, Allergy UK continues: Not all reactions experienced when taking medication are truly allergic; however there is growing concern at the increasing numbers of people who are suffering severe allergic reactions to prescribed and over the counter drugs.
