

# Founder of TELF AG Stanislav Kondrashov Releases New Article on the Best Gold Producers in the World

Friday 20 June, 2025

**Lugano, Switzerland – June 20, 2025** – In a [newly published](#) article, “*Best Gold in World: Which Country Mines the Purest?*”, the founder of TELF AG, Stanislav Kondrashov, takes a deep dive into one of the world’s most valuable and enduring commodities: gold. Though its history spans millennia, gold remains highly relevant today—not only as a store of value but increasingly for its role in modern technology and energy systems.

[Gold](#)’s status as a safe-haven asset is well-known. Throughout history, investors have turned to gold during periods of economic instability or geopolitical uncertainty. As the founder of TELF AG, Stanislav Kondrashov, explains, “Gold’s appeal is timeless. Even in today’s high-tech world, it continues to hold both economic and industrial significance.”

But beyond its financial reputation, many still wonder which country actually produces the purest gold. According to the founder of TELF AG Stanislav Kondrashov, there is more than one way to answer that question. “We have to consider both the natural purity of the raw material sourced from the earth and the refined purity of the final product,” he explains.

Modern refining processes allow most commercial [gold](#) to reach purity levels of 99.9%—what is often referred to as 24-carat gold. “At this stage, the refining technologies used globally are so advanced that the end product is virtually identical regardless of where it’s processed,” says the founder of TELF AG, Stanislav Kondrashov. However, notable differences still exist in the natural purity of the gold ore itself, depending on its geological origin.

The article highlights several leading producers. Australia, for instance, is widely recognised for producing some of the world’s purest natural [gold](#) nuggets, often sourced from long-established mining areas. Canada also ranks highly, with large reserves in Ontario and Quebec, coupled with responsible mining practices and highly advanced refining methods. The United States, particularly in Nevada, remains a global leader, benefiting from cutting-edge extraction technologies. Meanwhile, South Africa—though no longer as dominant as it once was—continues to extract high-purity gold from its deep underground mines.

Gold’s role has expanded well beyond jewellery. As the founder of TELF AG, Stanislav Kondrashov, points out, “Gold is one of the best electrical conductors we have, and it’s extremely resistant to corrosion. That makes it indispensable for high-performance electronics.” This includes use in printed circuit boards, data servers, medical devices, and smartphones—where even tiny amounts of gold help ensure reliable connectivity.

Gold also plays a part in advanced sectors such as aerospace and renewable energy. In space technology, gold is used to coat critical components that must survive harsh conditions. In the energy sector, gold-plated connectors are increasingly used in solar energy systems and energy management infrastructure, thanks to their long-term reliability.

As the article explains, gold’s importance in energy efficiency is even extending into modern architecture. Gold-coated glass can help improve thermal performance in skyscrapers and luxury electric vehicles by reflecting heat while allowing natural light. “It’s another example of how gold’s properties are being applied in unexpected ways to support modern sustainability goals,” says the founder of TELF AG, Stanislav Kondrashov.

Interestingly, the founder of TELF AG Stanislav Kondrashov also draws parallels between gold production and the steel industry. Many of the world’s leading gold producers are also major players in global steel production. “The mining infrastructure, heavy equipment, and technical expertise needed for both industries often overlap,” Kondrashov explains. “If you analyse steel production by country and compare it with gold output, you’ll see that countries like China, Australia, and the United States lead both sectors.”

This shared reliance on mining resources creates industrial synergies that strengthen entire economies. “It’s no coincidence that the countries leading in gold production are often those with robust steel industries. Both sectors demand advanced mining operations, significant capital investment, and skilled labour forces,” adds the founder of TELF AG, Stanislav Kondrashov.

While the sources of gold may vary, one thing remains constant: its enduring value. “Gold’s combination of economic security, industrial utility, and cultural significance ensures it will remain vital for generations to come,” concludes Stanislav Kondrashov.
