New map simplifies drone flying in the UK and helps keep our skies safe

Wednesday 20 April, 2016

20/04/16: READING, UK – Altitude Angel (<u>www.altitudeangel.com</u>) released an update today for its free online <u>Drone Safety Map</u> which helps drone operators fly their drone safely. The update now includes UK "no-fly zones" as well as details of over 18,000,000 ground hazards – such as schools, hospitals and power infrastructure - access to weather data and help interpreting drone regulations.

It is the most accurate map for drone operators in the UK and it's free.

The update comes just days after the news that a drone allegedly collided with a British Airways jet while landing at London's Heathrow Airport.

"We saw a 500% rise in the number of users on our site in a matter of hours", says Richard Parker, CEO, "proving that there is a real desire among drone operators to get access to this information and fly with care. The public and commercial drone operators need access to clear, concise and relevant information in order to be able to carry out their drone flights safely and today, that information is still surprisingly difficult to find without our map".

Regulators at home and abroad are calling for drone operators to be more mindful of the rules governing their flights, but many struggle as the data they need isn't readily available or relevant to them.

Altitude Angel's free <u>Drone Safety Map</u> focuses on providing authoritative, relevant data to drone operators using technology people already understand. This is critical to the safety of people and property and can help to minimise the risk of airborne incidents.

Parker adds, "while others do provide some of this data, it isn't frequently refreshed and often not clear what is and isn't relevant to those flying drones. This makes it much harder to fly safely."

The <u>Drone Safety Map</u> is already used by thousands of drone operators around the world - despite only being launched a few months ago - and is unique because it also aims to help drone operators interpret the regulations which apply to their flights as well as combining data from a variety of sources into a simple interface.

"We're on our way to solving the challenges faced by regulators as well as the concerns of the general public regarding the sudden surge in drone use around the world," says Parker. "Next month, we'll launch an open, global and automated air traffic control system for drones, together with a secure identity and registration system".

The company is working closely with regulators and manufacturers on its adoption.

-- ENDS --

Founded in 2015, Altitude Angel's (<u>https://www.altitudeangel.com</u>) mission is to provide accurate, up-to-date data directly to drones themselves, thereby helping drone manufacturers and operators to comply with local laws and safety standards with minimal effort. As part of its portfolio, Altitude Angel also provides a software platform that can be used to augment today's existing drones and control software with additional data to assist with safer flight planning and operation, while delivering enhanced 'situational awareness' to human operators.

The company is working on a system to enable drones to avoid collisions with each other or with other aircraft and no-fly zones automatically – without the need for expensive additional hardware - which will be ready in May 2016.
