

Only 8% Of Organisations Have AI Governance - QA Launches New Learning Paths To Close The Gap

Wednesday 24 September, 2025

London, UK

QA Ltd, the UK's largest tech training provider, has announced the launch of a new suite of AI learning paths, designed to help businesses adopt AI quickly, without compromising security and compliance.

Recent findings reveal that only **8% of organisations** have fully embedded AI governance, while **80% of enterprise AI failures** stem from poor cross-functional coordination. QA's new learning paths aim to close both of these critical capability gaps.

Speed matters, but AI safety is non-negotiable

Many businesses are facing a critical challenge: how to expand AI adoption responsibly. This launch addresses the growing concerns around fragmented AI implementation, siloed skills, and governance bottlenecks.

"In the race to adopt AI, speed matters. But safety is non-negotiable," said Richard Beck, QA's Portfolio Director for Cyber Security. "Our training pathways are built to ensure organisations don't have to choose between AI innovation and governance - they can have both. Not in opposition, but in a mutually empowering way."

AI learning pathways designed for real-world impact

QA's pathways have been created by AI and cyber security experts and are designed to help organisations adopt artificial intelligence at speed. The training programmes on offer include:

- **Certifications aligned with global AI frameworks** including ISO, NIST, and the EU AI Act
- **Expert-led training and simulations** for real-world impact
- **A cross-functional training approach**, to unify business, legal, and technical teams

These pathways are designed to tackle today's most pressing AI-related business challenges head-on. They provide role-based training that gives teams the skills to deploy AI securely and confidently, while recognising the wide range of departments involved in adoption.

Training is available for both technical specialists, including cyber security and software engineering, and non-technical teams such as compliance officers and business leaders.

QA's approach aims to ensure that every function is an enabler of safe, scalable AI adoption – not a blocker.
