

Revolutionising the commute is key to reducing UK carbon emissions, new research from Mobilityways reveals

Tuesday 29 September, 2020

- **Survey of 285,000 commuters finds more than one in four drivers could be walking or cycling and eight in ten could be sharing a lift with a co-worker**
- **Commuting accounts for 25 per cent of UK transport emissions, with UK commuters driving 25 billion miles a year**
- **Average Commuter Emissions Level (ACEL) fell by 20 per cent at peak of lockdown**
- **10 billion kg of CO₂e could be saved if more people walked, cycled, used public transport or car shared**
- **?Businesses have vital role to play in reducing commuting emissions**

To mark World Car Free Day (September 22), [Mobilityways](#) has released data that shows 10 billion kg of CO₂e could be saved if people commuted more sustainably, either by walking, cycling, using public transport or car sharing – the equivalent of London's carbon emissions for almost four months.

Transport is the biggest source of UK carbon emissions. In the UK, commuting accounts for 18 billion kg of CO₂e – 25 per cent of transport emissions and five per cent of total emissions. Mobilityways, a new organisation committed to helping businesses achieve zero carbon commuting, analysed travel data for 285,000 commuters across 200 major UK employers – the data highlights there is significant potential for people to commute more sustainably.

The data shows that 42 per cent of commuters could walk or cycle, 46 per cent could use public transport, and 92 per cent have one or more colleagues living within one mile of them who they could share a lift to work with. The average commuter has over five people they could share a lift with within walking distance of their home. But census data for England shows that only 15 per cent of commuters currently walk or cycle, 18 per cent use public transport and just 10 per cent share a car with a co-worker.

According to Mobilityways, the opportunity to reduce commuter emissions is currently being missed. The Department for Transport's Decarbonising Transport document, published in March 2020, does not mention commuters or the importance of employer travel plans. In addition, public sector and business greenhouse gas emission reporting does not need to include commuting and 'grey fleet' business miles.

Mobilityways helps organisations plan and implement sustainable commuting solutions. It is launching the UK's first average commuter emissions level ([ACEL](#))? online calculator? to help businesses and public sector organisations to make data-driven decisions on mobility planning and policy. Using data from an organisation's latest travel survey, it identifies the modes of travel that are emitting the highest levels of CO₂, and outlines how to lower emissions and meet carbon reduction targets using viable alternatives. Mobilityways also introduces customers to new tools, partners and travel operators to help them achieve zero carbon commuting. Organisations can benchmark their ACEL score against national and local averages.

Ali Clabburn, CEO of [Mobilityways](#), said: "Zero? carbon pledges cannot be met without reducing emissions from transport – which means decarbonising the daily commute is critical.

"Our commuting habits have barely changed in thirty years, we know that there is vast latent potential for people to travel more sustainably when they need to get to their workplace. But working from home also has a big part to play – we saw the national ACEL fall by 20 per cent at the peak of lockdown.

"Employers play an essential role in decarbonising the commute. Covid-19 is forcing businesses to re-examine their entire ways of working. As organisations overhaul their operations to manage social distancing and the health of their workforce, it's vital that commuting is considered as part of this mix."

Increasing average car occupancy on the commute from 1.1 per car to 1.2 per car would take 1.2 million commuting cars off the road, and save 1.2MtCO₂e – as much as doubling train use and has lower CO₂ /pkm (88.5g) than travel by bus (105g)**.

In addition to the environmental benefits, sustainable commuting also lowers business costs and personal expenses. Mobilityways' analysis showed that employee satisfaction can be improved by an estimated 22 per cent. Offering a wider range of mobility options makes employees' commutes more accessible, and less stressful and more enjoyable, and better commuting strategies are also thought to increase hiring and employee retention rates.

[Mobilityways](#)? is part of the [Liftshare Group](#), the UK's largest car-sharing platform with over 20 years' experience in changing commuter behaviour. As well as helping organisations to reduce carbon emissions, Mobilityways can deliver return on investment in just 1.5 months and is already working with 700 major brands, including the NHS, Virgin, Ocado and Bentley.
