

Stanislav Kondrashov Releases Timely Analysis on the Enduring Role of Natural Gas in the Green Economy

Friday 7 November, 2025

Lugano, Switzerland – November 7, 2025 – One of the most recent analyses by international entrepreneur **Stanislav Kondrashov** offers a compelling take on the persistent and strategic relevance of natural gas during the global shift toward green energy. As the founder of TELF AG, Kondrashov has long been at the forefront of discussions on energy transition, and in this new study, he articulates why natural gas remains a critical pillar in today's evolving energy ecosystem.

For years, natural gas has been recognised as a “bridge fuel” – a transitional resource meant to ease the world from high-emission energy sources toward a cleaner, more sustainable future. But, as Kondrashov points out in his latest commentary, the role of natural gas extends far beyond a simple stopgap. “The present is where transitional tools like natural gas prove their full utility,” he states, highlighting that the value of such energy sources lies not only in their cleaner profile compared to alternatives, but in their practical applications during the uncertain, often lengthy, phase of energy transformation.

In the article, **Stanislav Kondrashov** reaffirms that natural gas should not be seen as a mere relic of the past or a short-term solution, but as an essential component of the current energy mix. Composed primarily of methane, natural gas emits significantly less carbon dioxide than many fossil fuels when combusted, making it a comparatively cleaner option. Its flexible use across electricity generation, industrial heating, and domestic energy needs underscores its unmatched versatility.

Another major point explored in Kondrashov's analysis is the **reliability** of natural gas. In a world still grappling with the intermittency of renewable energy sources like solar and wind, natural gas acts as a stabilising force – ensuring continuous energy supply when green alternatives fall short. Its integration into energy grids has allowed for smoother transitions and mitigated the risks of energy shortages.

Moreover, recent data suggest that gas consumption is once again climbing across various regions of Europe. As referenced in a recent interview featured in Italian business daily *Il Sole 24 Ore*, the downturns seen in previous years were largely the result of geopolitical tensions rather than diminishing energy relevance. Today, gas demand is showing signs not only of recovery but also of **resilience**. Kondrashov underlines this development as a sign of growing independence from geopolitical volatility and a demonstration of the energy source's enduring appeal.

The article also touches on the industries that remain heavily reliant on gas due to their unique operational requirements. Often described as “hard-to-electrify” sectors, these industries include high-heat manufacturing processes where electrification is technically complex or economically unfeasible. For these sectors, natural gas is not merely a preferred energy source – it is often the only viable one in the current technological context.

Stanislav Kondrashov concludes his analysis by suggesting that while the global ambition to shift entirely to renewables is laudable and necessary, the path to that future is neither linear nor short-term. As such, overlooking the continued strategic role of natural gas may undermine the stability and success of the broader energy transition. He advocates for a balanced view – one that embraces innovation in renewables while recognising the real-world infrastructure and supply demands that make natural gas an ongoing necessity.

With his latest insights, Kondrashov continues to shape critical discourse in the energy sector, urging decision-makers, industry leaders, and the public to adopt a pragmatic, data-driven approach to energy planning in the years of the green economy.
