

## TRI-PIN - the future of PIN security

Wednesday 22 January, 2014

TRI-PIN is an award winning revolutionary PIN system that makes it impossible for people to discover - even if they see or record you typing it in. The inventor of TRI-PIN, Glynn Reynolds, patent has now been published. ( UK patent code: GB 2504157).

The idea for TRI-PIN came after one of Glynn's friends was a victim of bank machine fraud. It can be used on Smart phones, tablets, computers, safes, apps, door access and much much more.

### How Does it Work?

It looks like much like any other 10 digit keypad, but instead of each button having just a number, they also have a colour and a symbol/shape.

A user chooses a PIN with a combination of numbers, colours and shapes/symbols, for example - 3, square, pink, flag.

Each time that the user has to input their pin, the colours and symbols randomly change position on the TRI-PIN keypad, so you're never pressing the same sequence of keys.

It is a ideal design for touch screen devices, but can also work on computers, ATM machines (with a colour screen), safes and other devices that don't have a touch screen. Because the numbers are static, you press the corresponding key that TRI-PIN shows on the screen. For example, if pink is the first part of you pin, and it's on 3, you press the 3 one the keypad or keyboard.

Says Glynn Reynolds: " TRI-PIN is a very simple, but effective idea with a higher level of security than traditional PINs. The great thing about TRI-PIN is that it's a software solution, so if it was available on Apple/Android, all you need to do is update current devices rather than upgrade or change them."

The first company to use TRI-PIN is Lunabee on there oneSafe app on iPhone, iPad and Mac.

If you are interested in licencing TRI-PIN or want more information please email [info@tri-pin.com](mailto:info@tri-pin.com) Glynn is also open to offers for selling the patent.
