The HoverTrimming Kit News

Supercharge Your Traditional Grass String Trimmer With a new Hover Trimmer Kit

The Aerodynamic Blade Reduces Noise, Fuel Emissions, Time And Energy.

In the past few decades, petrol-powered grass string trimmers have become virtually everyday landscape maintenance tools. Millions of homeowners and professional landscapers can't even imagine living without a handy, labor-saving string trimmer.

But string trimmers are not without their problems and frustrations. Sometimes the line doesn't feed properly. Sometimes the string just isn't tough enough to cut heavy weeds. The line can become tangled and reloading a new spool of line can become a frustrating, time-consuming chore.

Now there's a new kit that promises to supercharge petrol (only) powered string trimmers-turning them into leaner, cleaner, cutting machines. The new Grass Hover Trimmer Kit replaces a standard strimmer's spool head with a unique four-line blade cutting system.

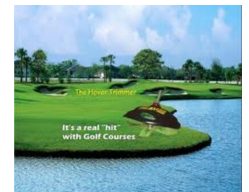

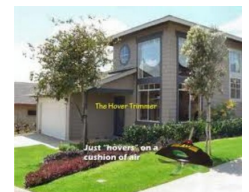

The new star blade which is made of high-quality stainless steel uses technology traditionally associated with the aeronautical industry. The Hover Trimmer is specifically designed to produce a cushion of air which the trimmer literally floats on, this gives it an almost weightless feel, making it easy to manoeuvre and effortless to operate.

The aerodynamically engineered blade is tough and durable enough to slice through long grass, bracken, bushes, hedges, heavy weeds and vines that string lines can't even begin to cut. The blade is housed in an aerodynamically designed, lightweight hover dome that increases the operating speed and performance of the old strimmer.

The Hover Trimmer can operate at less than half the engine power and at much lower speeds than required for normal line trimming. The result is a reduction in fuel use, noise, engine emissions and wear and tear. The Hover Trimmer can cut through it's workload in half the time of a traditional string trimmer.
