Who is NetFlowCoin and how are they taking on the whole internet?

Tuesday 7 June, 2022

NetFlowCoin Foundation, Singapore, 15th May 2022 - NetFlowCoin is fast becoming a prominent player in the decentralized internet space. As the current industry continues to march into the mainstream, it's difficult to determine which company is bringing real value to the fold. Where to store, share, stream data, communicate, and how to do it safely and permanently are becoming an issue that users have to think about.

The concept of the next-generation internet, commonly referred to as web 3.0, will be classified as the internet of the people. When we look beyond this meaning, we uncover the core features that enable people to take back ownership over their data, and break the chains that have been restricting us across the current web 2.0 internet architecture.

Numerous blockchain-based projects have been unsuccessful in laying down a foundational communications layer that can allow for a decentralized free and open internet.

NetFlowCoin is built upon these capabilities to create a digital economy that enables users, miners, and developers the autonomy to store, share and stream any type of data across a decentralized internet.

The core value of web 3.0 solutions

Ultimately the world is clamoring toward a free and open internet, that operates similar to how we are currently accessing information, but without the constraints that centralized bodies have applied to it. Web 3.0 is an even more fundamental disruption, one that leans forward to openness, trustlessness, and permissionless networks.

Many web 3.0-based projects have yet to show real value in today's market and are blind-sighting potential investors into believing they are at the forefront of new technological innovations.

The development of blockchain technologies is no easy task, and many people fail to dive deeply into each project's technology. NetFlowCoin's network is built using a next-generation SDVN protocol aiming to make the web safer, decentralized, and faster. It has been tried and tested over the last 10 years and adopted by numerous fortune 500 companies.

The SDVN protocol has been built upon by numerous third-party companies and has now accumulated well over 4.5 million users. The SDVN protocol acts as a virtual network built above the physical infrastructure, that enables complete P2P data streaming, storing, and sharing.

The vision of the NetFlowCoin Foundation is to become the foundational layer that will support the next internet. NetFlowCoin gives users the power to take back control of their digital lives, and be part of this new online era that is free, secure, and unrestricted.
